

## “I was told it couldn’t be done. Luckily, Saniflo had the answer.”

When old or historical buildings are refurbished, relocating facilities can be both difficult and challenging, especially when sewer systems are located on the opposite side of the building.

This was the challenge that faced Ray Fox, who’s 4th floor apartment is located off fashionable Flinders Lane in Melbourne.

“Our immediate problem was created because we wanted to locate all our bathroom, laundry and kitchen away from the main sewer line connection point. This prevented us from running all the waste pipes on gravity to the sewer since building regulation prohibited us from coring into the concrete floor,” explains Ray.

“After inspection by the Saniflo servicing division, it was recommended that two products were needed to effectively and efficiently pump the waste out. Sanivite for the kitchen and laundry areas and Sanipro for the bathroom were identified as the two preferred models to undertake this task,” explains John Fraser (Saniflo service manager).

“As waste water can be pumped through small-bore 20/25mm diameter pressure pipe, vertically up to 5 metres or horizontally up to 50 metres there was no need to cut up concrete or use large diameter pipes, in Ray’s apartment,” adds John.

“I’ve found both Saniflo products to be highly efficient and effective,” concludes Ray, “it’s been a very reliable solution.”

With over five million units sold worldwide and over 50 years experience in delivering innovative plumbing solutions, Saniflo products allow anyone to incorporate bathroom fixtures, laundry rooms or kitchens virtually anywhere without any major construction work.
